

WIRELESS MEDIA PLAYER

ABSTRACT OF THE DISCLOSURE

A system and a method for wireless playing media files utilizing a central server, in which a database of media files is stored, is described. The system includes a base-station connected to the server, a set of media clients that can be placed in different locations within the service area of the base-stations. The media clients can wirelessly connect to the server via the base-station to access the media files database and download media files, decode and play the media files. The media clients can be connected to devices capable of outputting the media files decoded and played by the media clients. The media clients can be also incorporated into mobile devices and cars, such that a user can download media files from the server and be able to display them at a location remote from the server and the service area of the base-station.
